

UI/UX Design Brief

InfusioTech Restaurant Ordering SaaS | Version 1.0 | 2 October 2026

Purpose

A screen inventory and interaction brief for design in Figma or an equivalent design tool.

Design Principles

- Mobile-first, fast to learn, readable at a glance, accessible contrast and large touch targets.
- Use a consistent status color/label system but never rely on color alone.
- Role-aware navigation: show permitted functions only; backend remains authoritative.
- Support poor connectivity with clear loading, retry and stale-data indicators.

Customer Web Screens

- Restaurant landing/menu; category and item detail; variant/add-on selection; cart; checkout/payment choice; order confirmation; order tracking; review link.
- Mobile browser layout should minimize typing and preserve cart state safely for a short session.

Restaurant Mobile App Screens

- Login/activation; tenant selection; role-aware home; live orders; order details; table view; notifications; profile.
- Owner: menu/category editor; item editor; QR/table manager; staff list; invite staff; role/permission editor; customer list; analytics; restaurant settings; subscription/billing.
- Staff: show only permitted order, kitchen, table and payment screens. Provide clear reason when access is restricted.

Super Admin Screens

- Tenant search/detail; subscription status; support case; platform configuration; usage/health overview; QR/NFC asset administration.
- Support access to tenant information must be limited, reason-coded and audited.

Key Interaction States

- Empty, loading, success, validation error, network failure, permission denied, suspended account, expired invitation, payment pending/failure.
- Confirm destructive actions and sensitive permission grants. Show order status history and payment status separately.

Prototype Deliverables

- Information architecture; low-fidelity wireframes; high-fidelity mobile and responsive web screens; reusable component library; clickable core flows; accessibility and responsive behavior notes.
