

Deployment & DevOps Guide

InfusioTech Restaurant Ordering SaaS | Version 1.0 | 2 October 2026

Purpose

Operational checklist for safely releasing and maintaining the platform.

Environments

- Local development, shared staging and production must use separate projects, databases, keys, buckets and gateway credentials.
- Never copy production customer data into development; use synthetic data or approved anonymized fixtures.

CI/CD

- Run lint, type checks, unit tests, API tests, dependency/security scans and migration validation on pull requests.
- Deploy web/backend changes to staging first; run smoke and tenant-isolation checks; require approval before production.
- Use versioned mobile builds and staged rollout; maintain rollback plan for web/backend compatibility.

Secrets & Configuration

- Store secrets in managed secret storage/CI variables; never commit API keys or service-role credentials.
- Separate public client config from privileged server secrets; rotate credentials after exposure or staff changes where applicable.

Database & Backups

- Use reviewed, versioned migrations and a documented forward/rollback strategy.
- Set backup frequency and retention based on agreed RPO; periodically test restore to isolated environment.
- Protect production access and log privileged database operations.

Monitoring & Incident Response

- Track API latency/error rates, order creation, payment webhook delay/failure, realtime connectivity, notification delivery and resource usage.
- Define alert owners and severity; document incident triage, customer communication, mitigation, recovery and post-incident review.
- Maintain status communication and support escalation channels.

Release Checklist

- Release notes and migration review complete; staging smoke tests pass; backups verified; secrets checked; monitoring active; support team briefed; rollback decision owner assigned.
